1   Session 12: interfacing stored media II: Content-based organization and visualization of music   98%
archives
Elias Pampalk , Andreas Rauber , Dieter Merkl
Proceedings of the tenth ACM international conference on Multimedia December 2002
With *Islands of Music* we present a system which facilitates exploration of music libraries
without requiring manual genre classification. Given pieces of music in raw audio format we
estimate their perceived sound similarities based on psychoacoustic models. Subsequently, the
pieces are organized on a 2-dimensional map so that similar pieces are located close to each
other. A visualization using a metaphor of geographic maps provides an intuitive interface
where islands resemble genres or ...

2   Determining computable scenes in films and their structures using audio-visual memory   85%
models
Hari Sundaram , Shih-Fu Chang
Proceedings of the eighth ACM international conference on Multimedia October 2000

In this paper we present novel algorithms for computing scenes and within-scene structures in
films. We begin by mapping insights from film-making rules and experimental results from
the psychology of audition into a computational scene model. We define a computable scene
to be a chunk of audio-visual data that exhibits long-term consistency with regard to three
properties: (a) chromaticity (b) lighting (c) ambient sound. Central to the computational model
is the notion of a causal, finite-me ...

1   Ephemerons: a new finalization mechanism   88%
Barry Hayes
**ACM SIGPLAN Notices , Proceedings of the 1997 ACM SIGPLAN conference on
Object-oriented programming systems, languages and applications** October 1997
Volume 32 Issue 10
Finalization occurs when a garbage collector informs an application that an object is "almost
collectable." It is used to help an application maintain its invariants. To make finalization
more useful, this paper defines "almost collectable" in terms of a new class of objects, called
ephemerons. Ephemerons are similar to weak pairs, but an object in an ephemeron's key field
may be classed as "almost collectable" even if it is reachable from the epehemeron's value
fields.

2   Error checking with pointer variables   82%
Marvin V. Zelkowitz , Paul R. McMullin , Keith R. Merkel , Howard J. Larsen
Proceedings of the annual conference October 1976
The use of pointer variables in a programming language often results in a difficult class of
errors to detect. Pointers may point to storage that no longer is allocated, or storage may be
allocated as one data type and accessed as another. This report describes the implementation
of pointers in the PLUM PL/1 compiler such that all error conditions are detected. In addition,
preliminary tests with PLUM seem to indicate that the total checking of pointers is not as
expensive an operation as i ...

3   A computer model of rainfall runoff from a system of multiple watersheds   77%
Ruh-Ming Li , Brent E. Spronk , Daryl B. Simons
Proceedings of the 10th conference on Winter simulation - Volume 2 December 1978
Due to increasing interest in water resource planning, many computer models have been
developed to simulate rainfall-runoff relationships. A useful model for predicting this
